These linkers separate the individual moeities by such a distance that each component of the fusion protein is by such a distance that each component of the fusion protein for its biological activity. These fusion proteins may be used in therapy, diagnosis and assays for conditions mediated by TNF or IL-1, therapy, diagnosis and assays for conditions mediated by TNF or IL-1, therapy, may be used to treat cachexia, rheumatoid arthritis, diabetes, multiple sclerosis, pulmonary fibrosis and silicosis, diabetes, multiple sclerosis, pulmonary fibrosis and silicosis, cerebral malaria, allograft and xenograft rejection in graft verses host disease, sepsis, septic shock, inflammation, allergies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1993-336592/42.

        This protein is the soluble human interleukin-1 receptor (IL-IR). by mutating codon 336 (AAG) of the CDNA encoding IL-IR (AAQ71901), to form a stop codon (TAG) a truncated receptor, comprising the extracellular domain only, is generated. This truncated receptor retains its ability to bind interleukin-1 but is released extracellularly and therefore is inactive in signal transduction. The methods of the invention are useful for preventing the development of arthritis and for therapeutic use, eg. for repairing and regenerating the connective tissue. The gene is also useful in a compound for parenteral administration for prophylaxis or treatment. (Also see AAR59091 for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAR60870
              The amino acid sequence of the human interleukin-1 (IL-1) receptor (IL-1R) encoded by the insert fragment R3A. The gene (AAQ73764) encodes CC a 65 kD protein precursor which is converted to 63.5 kD protein. The CC protein then undergoes glycosylation to produce a protein of around CC 82 kD. The gene was isolated from a cDNA library, derived from RNA from CC a human T-cell line (designated clone 22), by using a probe prepared CC from the murine IL-1R gene sequence (AAQ73762). Nine positive clones CC complete coding region of the human IL-1R. The purified IL-1 receptor, CC as part of compositions, can be used for the diagnosis of IL-1 or its CC receptors. The receptor will also be useful for the production of CC antibodies used in diagnosis and therapy. In addition, the purified IL-1, CC thereby providing means for regulating the immune or inflammatory CC activities of IL-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Murine; interleukin-1; receptor; glycoprotein; human; IL-1-alpha; expression vector; antibody; diagnosis; therapy; IL-1; IL-1R regulation; regulate; immune; inflammatory; activity; ss.

Human interleukin-l receptor I-type (IL-IR) preferably comprises of amino acids 1-319, and more preferably is a soluble protein comprising of amino acids 1-312. It is useful as a bone resorption inhibitor and can be administered intravenously or intramuscularly. A pharmaceutical composition, containing IL-IR as an active ingredient, helps prevent and treat metabolic diseases of the bone matrix which are caused by the abnormal decrease of calcium and bone matrix in the bone, e.g. osteoporosis and hypercalcaemia. The IL-IR is a superior therapeutic agent to the prior art medications giving a more satisfactory effect for metabolic bone diseases caused by abnormal bone resorption by inactivating osteoclasts. Bone resorption inhibitory activity of the protein has been proved by assaving a direct action on osteoclast activity.
                                                                                                                                                                                                                              Composition contg. interleukin-1 receptor, or soluble fragment treating and prophylaxis of metabolic bone diseases e.g. osteoporosis or hypercalcemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Interleukin-1 receptor; IL-1R; (
synoviocyte; connective tissue; 
gene therapy; retrovirus.
                      The human interleukin-1 receptor (IL-IR) (AAW06541) amino acid sequence can be deduced from a cDNA clone (AAT45876) isolated from a sequence can be deduced from a cDNA clone (AAT45876) isolated from a human T-cell cDNA library. cDNA encoding the extracellular IL-1 binding domain of IL-IR can be generated by PCR (see also AAT45878-79) and incorporated into a retrovirus vector subsequently used to transfect a packaging cell line. Viral particles are produced that can be used to infect synovial cells in culture. Infected cells are then transplanted into the damaged cartilage of a patient. Soluble IL-IR is expressed that binds to and neutralises IL-1 in vivo, preventing degradation of cartilage, as a means of treating arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-MAR-1997

                                                                                                                                                                                                                           The present sequence represents a human interleukin-1 (IL-1) polypeptide. The IL-1 polypeptide is used in the method of the invention. The specification describes a method for inhibiting leukocyte infiltration or cartilage degradation in a joint of a mammal. The method comprises administering a viral vector encoding a protein of interest, such that expression of the protein within the joint results in an inhibition of leukocyte infiltration or cartilage degradation in the joint. This protein is an IL-1 receptor antagonist (IRAP), soluble IL-1 receptor, soluble tumour necrosis factor-alpha (TNF-alpha) receptor, IL-10, or their biologically active fragments or derivatives. The method is used for treating connective tissue disorders by inhibiting leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting leukocyte infiltration or cartilage degradation in mammalian joint, comprises administering a viral vector comprising a nucleotide sequence operably linked to a promoter encoding a protein of interest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A human interleukin-1 (IL-1) receptor polypeptide

                                                                                                                                                                                                                                                                                                                                The present invention provides a method of producing a protein in the joint of a mammal, involving the intra-articular administration of a viral vector comprising the coding sequence of the desired protein, a where the protein is expressed in a synovial cell. This is useful in treatment of joint pathologies such as arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-SEP-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a a nucleic acid molecule (NAM). The method comprises: (a) contacting a product of a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a interaction between the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and line cancer and cancer and cancer and cancer and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-JUL-1998;

The invention relates to a method for identifying a compound capable of affecting the binding of a syntaxin-binding period, e.g. SNAP-25, alpha-SNAP, n-secl or VAMP, to syntaxin. The method comprises measuring the effect of the test compound on the extent of binding between the SBP and the SBP-binding site on syntaxin. The method can be used for
